## Features and Benefits

- Integrally cast mounting pad provides direct mounting of many actuators.
- Rocker-shaped gland bridge compensates for uneven adjustment of gland nuts.
- Extended neck allows for two inches of pipeline insulation.
- Flattened body bore at stem journal ports positions stem bearings near disc, providing maximum stem support.
- Disc taper pins are tangentially positioned half in disc and half in stem, placing them in compression rather than shear, which eliminates potential for failure.
- Integrally cast disc position stop perfectly locates the disc in seat, achieving maximum seat and seal life.
- Uninterrupted flange face retaining ring allows use of standard spiral wound gaskets and provides uni-directional dead-end service as standard. Bi-directional dead-end service is available.
- K-LOK polymer, elastomer, and fire-safe seats provide bi-directional, drop-tight closure in vacuum and throughout all pressure ranges, as well as at full rated differential pressure. A variety of materials allows optimum seat life in all applications.

## Principles of Operation

### Double Offset Disc/stem

K-LOK's unique two-piece stem and double-offset disc/stem design allows for high cycling and creates a lower disc profile with increased capacity and a rangeability of 33:1.

In addition to increasing the flow area across the disc, this design minimizes wear points between seat and disc.

The first offset is achieved by locating the stems downstream of the center-line of the seat. This allows for a totally unobstructed 360° sealing surface.

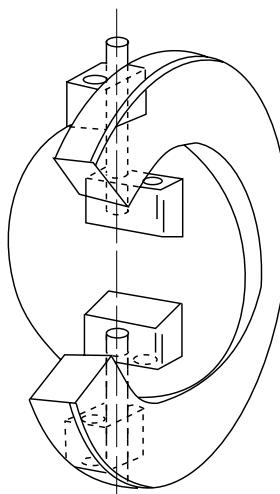

The second offset locates the stems off-center of the vertical axis of the seat.

The combination of these two offsets creates a camming effect as the disc swings into and out of the seat. The disc lifts quickly out of the seat in the first few degrees of travel and does not contact the seat again until it is nearly closed. There are no wear points between the seat and disc, while operating torques are reduced and seat life is extended.

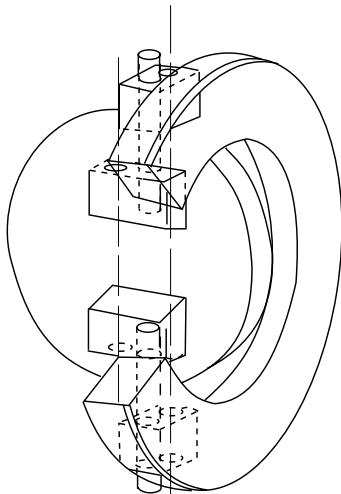

### Two-piece Stem vs. One-piece Stem

K-LOK's disc geometry maximizes flow capacity by increasing the available flow area through the valve. This increase in disc efficiency results in a higher valve Cv.

## Fire-Safe Valve

### API 607 4th Edition Approved by Third Party Witness

The K-LOK fire-safe design uses a stainless steel or MONEL® alloy seat of convoluted shape that mates with an RTFE member. In the full-closed position, the K-LOK provides continuous two-plane contact between the disc and both metal and RTFE seats. The fire-safe seat utilizes wire windings to provide the circumferential stiffness necessary to maintain interference between disc and seat.

## Fire-Safe Seat

## Fire-Safe Packing

K-LOK fire-safe packing is composed of three rings of preformed graphite between one ring of woven graphite rope at the top and bottom.

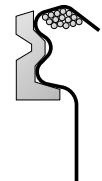

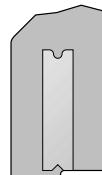

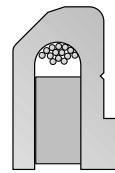

This arrangement creates a superior, high temperature seal against the outer wall of the packing box and around the rotating stem.

## Seat Materials

Seat	Material	Typical Applications
PTFE	Polytetrafluoroethylene	Pharmaceuticals, water, jet fuel, river water, air
RTFE	Reinforced Polytetrafluoroethylene	Saturated steam, chlorine, ammonia, natural gas vacuum, oxygen, nitrogen
UHMWPE	Ultra high molecular weight polyethylene	Abrasives, suspended solids, scaling mediums
Wire Wrap	302 stainless steel braided wire	
Backing Ring	Polyester or phenolic stainless steel	General purpose services Steam, ammonia
EPDM		Cooling water, chilled water,
NBR		HVAC, river water intakes,
Fluoroelastomer (FKM)		abrasives, vacuum
Backing ring	Carbon steel	
Metal	316 Stainless steel (flash chrome coated)	High temperature, low temperature, abrasives, fly ash, slurries
Wire Wrap	316 stainless steel	
Fire-safe	Reinforced polytetrafluoroethylene combined with 316 Stainless Steel (flash chrome coated)	Fire-safe installations, abrasives, slurries, steam
Wire Wrap	316 stainless steel	

## Seat Design

The K-LOK seat is a true interference seat design and does not rely on line pressure to assist in sealing. All seats seal drop-tight bi-directionally at low pressure as well as high pressure.

Polymer (PTFE, RTFE and UHMWPE) seats incorporate a stainless steel braided wire winding, enclosed in a U-shape envelope to provide seating energy and memory. This wire winding allows axial flexibility in both directions of flow. The winding also allows radial flexibility when the disc is not fully closed, reducing seat/disc interference, seat wear and stem torque. When the disc closes, it provides circumferential stiffness and assures the required disc/seat seals tight.

Elastomer seats are molded around a stack of V-shaped steel rings that provide the same stability, support and flexure as the wire windings in polymer seats.

Metal seats employ a stainless steel or MONEL® ring of convoluted shape, reinforced by stainless steel wire windings. The thin, convoluted shape allows for expansion and contraction from thermal cycling. Long life is assured by flash coating the seat with chrome.

**Vacuum Rating**

The combination of interference fit seats and bi-directional packing makes the K-LOK especially well suited for vacuum service.

Standard K-LOK high performance valves are rated to an absolute pressure of  $4 \times 10^{-5}$  inch Hg. Higher vacuum applications are available.

**Seating and Un-seating Torque**

Seating and un-seating torques are a function of the size of the valve and the shutoff pressure of the system.

Specific torque ratings can be found in the Seating/Un-seating chart at the intersection of the 'size' row and the 'shutoff pressure' column.

Torques listed are for PTFE and RTFE seated valves. For different seat materials specific multipliers are to be used as stated.

All torques listed are for normal service conditions (i.e. operating frequency is a minimum of once per month; disc corrosion is expected to be mild or minor, the media is a clean gas, liquid or steam, and is non-abrasive) and chemical affects upon the seat are minor.

**PTFE and RTFE Bi-Directional Seating and Un-Seating Torque Values**

\*CAE and CAG mounting codes apply for shaft mounting of UHMWPE, metal and fire-safe seats.

**Notes**

1. Torques are applicable only to PTFE and RTFE seats. For fire-safe and metal seats, select only the torque applicable for the valve at 285 psig and multiply by 2.0.
2. For other seat materials, select the torque applicable for the maximum differential pressure and multiply by the following factor:  
 EPDM/NBR/Fluoroelastomer (FKM) x 1.4  
 UHMWPE (Clean Service) x 1.3  
 UHMWPE (Slurry Service) x 1.7

## Notes

- Surrounding air temperature is assumed to be 70°F. For every degree over 100°F of the surrounding air, deduct 2 degrees from the temperature ranges shown above. (Example: 125°F external reduces maximum temperature values to 325, 410, 510, 600, etc.)
- Valves may be insulated or uninsulated.
- Brackets may be open rectangular tubes or the standard closed Keystone tubular stem extensions.
- All actuators have a maximum service temperature (outside atmosphere). These temperature limitations apply regardless of K-LOK extension lengths.

## Notes

- The maximum safe pull made by an operator is about 120 pounds. The effective length of the handle moment arm is 9 1/4-inches for the 10 1/2-inch handle and 12 3/4-inches for the 14-inch handle. This is based on the average operator's hand width.
- Chart is based on full pressure differential. K-LOKs up to 6-inch can be fitted with a handle when pressure is reduced. Please contact Keystone Valve for assistance.

## K-LOK Services

Many services have specific requirements. Keystone can meet most of these needs. The K-LOK product line can be ordered for the following special services:

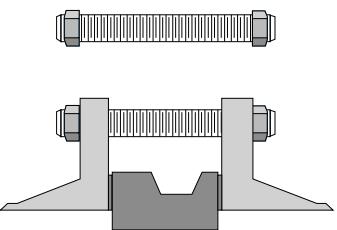

- Food processing
- Sour gas
- Military
- Vacuum
- Oxygen
- Pharmaceutical
- Steam
- Steam jacketed
- Ammonia
- Chlorine
- Reverse osmosis
- Category 'M' fluids
- Slurry
